## **CHAPTER 1 : INTRODUCTION**

### **1.1 Company Profile**

- Client Name: Vijay Sahu
- Shop Name: Shau collection store
- Address: Akurdi railway station, Gurudwara chowk, Pune

### **1.2 Existing System and Need for System**

- The system is currently offline with mandatory billing system.
- Lack of security data.
- More man power.
- Time consuming.

#### **Need for System:**

To automate existing manual system by help of computerized equipment's/software, so that their valuable data can be stored for longer period.

- To make shopping easy and convenient for the customer's.
- User can 'View/Select/Buy'
- Error free, reliable management system for good performance & better services for the user.
- Customers can place the order online and received at their doorstep.

### **1.3 Scope of Work**

- Customers can surf 24\*7 by providing 24\*7 services.
- Features can be updated/added
- Solving the customers quarries
- Customer can give their feedback

### **1.4 Operating Environment –**

#### **Hardware and Software**

Processor: Intel core Processor Pentium 4

Operating System: Windows 7 and Above

RAM: 2GB and Above

Hard Disk: 40GB and Above

#### **Software:**

Frontend: HTML , CSS , Bootstrap, JavaScript

Backend: JSP , MySQL .

## 1.5 Detail Description of Technology Used

- **HTML**

- **Why to learn HTML?**

HTML stands for Hyper Text Mark-up Language.

HTML is the standard markup language for creating Web pages.

HTML describes the structure of a Web page.

HTML consists of a series of elements.

HTML elements tell the browser how to display the content.

HTML elements label pieces of content such as "this is a heading", "this is a paragraph", "this is a link", etc.

- **Advantages of learning HTML:**

HTML helps to build structure of a website and is a widely used Mark-up language. It is easy to learn. Every browser supports HTML Language. HTML is light weighted and fast to load. Storage of big files is allowed because of the application cache feature. Do not get to purchase any extra software because it's by default in every window. Loose syntax (although, being too flexible won't suit standards). HTML is simple to edit as being a plain text. It integrates easily with other languages such as JavaScript, CSS etc. HTML is that it is easy to code even for novice programmers. HTML also allows the utilization of templates, which makes designing a webpage easy. It is fast to download as the text is compressible. Very useful for beginners in the web designing field. HTML can be supported to each and every browser, if not supported to all the browsers. HTML is built on almost every website, if not all websites. HTML is increasingly used for data storage as like XML syntax. HTML has much tag and attributes which can short your line of code.

- **Characteristics of HTML:**

- ❖ It is easy to learn and easy to use.
- ❖ It is platform-independent.
- ❖ Images, videos, and audio can be added to a web page.
- ❖ Hypertext can be added to the text.
- ❖ It is a mark-up language.

- **CSS**

- **Why to learn CSS?**

CSS stands for Cascading Style Sheets. CSS describes how HTML elements are to be displayed on screen, paper, or in other media. CSS saves

a lot of work. It can control the layout of multiple web pages all at once. External style sheets are stored in CSS files.

➤ **Advantages of learning CSS:**

Faster Page Speed. More code means slower page speed. Better User Experience. CSS not only makes web pages easy on the eye, it also allows for user-friendly formatting. Quicker Development Time. Easy Formatting Changes Compatibility across Devices. The Script offer consistent platform independence and can support latest browsers as well. To make a global change, simply change the style, and all elements in all the web pages will be updated automatically. You can write CSS once and then reuse the same sheet in multiple HTML pages. You can define a style for each HTML element and apply it to as many Web pages as you want.

➤ **Bootstrap**

Bootstrap is a free and open source CSS framework directed at responsive, mobile-first front-end web development. It contains HTML, CSS and JavaScript based design templates for typography, forms, button, navigation, and other interface components. Bootstrap also comes with several JavaScript components which do not require other libraries like JQuery. They provide additional user interface elements such as dialog boxes, toolkit progress bars, navigation drop-downs, and carousels. Each Bootstrap component consists of an HTML structure, CSS declarations, and in some cases accompanying JavaScript code. They also extend the functionality of some existing interface elements, including for example an auto-complete function for input fields.

• **JavaScript**

➤ **Why to learn JavaScript?**

It's the most popular programming language. It's in your browser. JavaScript also exists outside of the internet. JavaScript is Ideal for Newbies. JavaScript is Easy to Learn. You Can Create Visual Effects and Other Eye-catching. Aesthetic Features. JavaScript is Versatile.

➤ **Advantages of learning JavaScript:**

Speed, Since JavaScript is an 'interpreted' language. It reduces the time required by other programming languages like Java for compilation. Simplicity, JavaScript is easy to understand and learn. Popularity Interoperability, Server Load, Rich Interfaces, Extended Functionality. Versatility.

➤ **Characteristics of JavaScript:**

Scripting Language, JavaScript is a lightweight scripting language made for client-side execution on the browser. Interpreter Based. Event Handling, Lightweight. Case Sensitive Control Statements. Objects as first-class citizens, Functions as First-class citizens (supports functional programming).

## **Java**

Java is a high-level, class-based, object-oriented programming language that is designed to have as few implementation dependencies as possible. It is a general-purpose programming language intended to let programmers write once, run anywhere (WORA) meaning that compiled Java code can run on all platforms that support Java without the need to recompile. Java applications are typically compiled to bytecode that can run on any Java virtual machine (JVM) regardless of the underlying computer architecture. The syntax of Java is similar to C and C++, but has fewer low-level facilities than either of them. The Java runtime provides dynamic capabilities (such as reflection and runtime code modification) that are typically not available in traditional compiled languages. As of 2019, Java was one of the most popular programming languages in use according to GitHub particularly for client-server web applications, with a reported 9 million developers. Java was originally developed by James Gosling at Sun Microsystems. It was released in May 1995 as a core component of Sun Microsystems' Java platform. The original and reference implementation Java compilers, virtual machines, and class libraries were originally released by Sun under proprietary licenses. As of May 2007, in compliance with the specifications of the Java community process, Sun had relicensed most of its Java technologies under the GPL-2.0 only license. Oracle offers its own Hotspot Java Virtual Machine, however the official reference implementation is the OpenJDK JVM which is free open-source software and used by most developers and is the default JVM for almost all Linux distributions.

## **JDBC**

Java Database Connectivity (JDBC) is an application programming interface (API) for the programming language Java, which defines how a client may access a database. It is a Java-based data access technology used for Java database connectivity. It is part of the Java Standard Edition platform, from Oracle Corporation. It provides methods to query and update data in a database, and is oriented toward relational databases. A JDBC-to-ODBC bridge enables connections to any ODBC-accessible data source in the Java Virtual Machine (JVM) host environment.

## **JSP**

Java Server Pages (JSP; formerly Java Server Pages) is a collection of technologies that helps software developers create dynamically generated web pages based on HTML, XML, SOAP or other document types. Released in 1999 by Sun Microsystems JSP is similar to PHP and ASP, but uses the Java Programming Language.

## **MySQL**

MySQL is an open source relational database system (RDBMS). Its name is a combination of "My", the name of co-founder Widenius daughter my, and "SQL", the acronym for Structured Query Language. A relational database organizes data into one or more data tables in which data may be related to each other; these relations help structure the data. SQL is a language programmers use to create, modify and extract data from the relational database, as well as control user access to the database. In addition to relational databases and SQL,

an RDBMS like MySQL works with an operating system to implement a relational database in a computer's storage system, manages users, allows for network access and facilitates testing database integrity and creation of backups.

### **Tomcat**

Apache Tomcat (called "Tomcat" for short) is a free and open- source implementation of the servlet and Web Socket technologies. It provides a "pure Java" HTTP web server environment in which Java code can also run. Thus it's a Java web application server, although not a full JEE application server.

## **CHAPTER 2 : PROPOSED SYSTEM**

### **2.1 Proposed System**

1. Reduce cost of management of product.
2. Easy access to product.
3. Site search is a functionality that provides customers with the ability to quickly search
4. Detailed Summary for customers of product via website
5. Accepting online payment/offline(cod) through customer

### **2.2 Objectives of System**

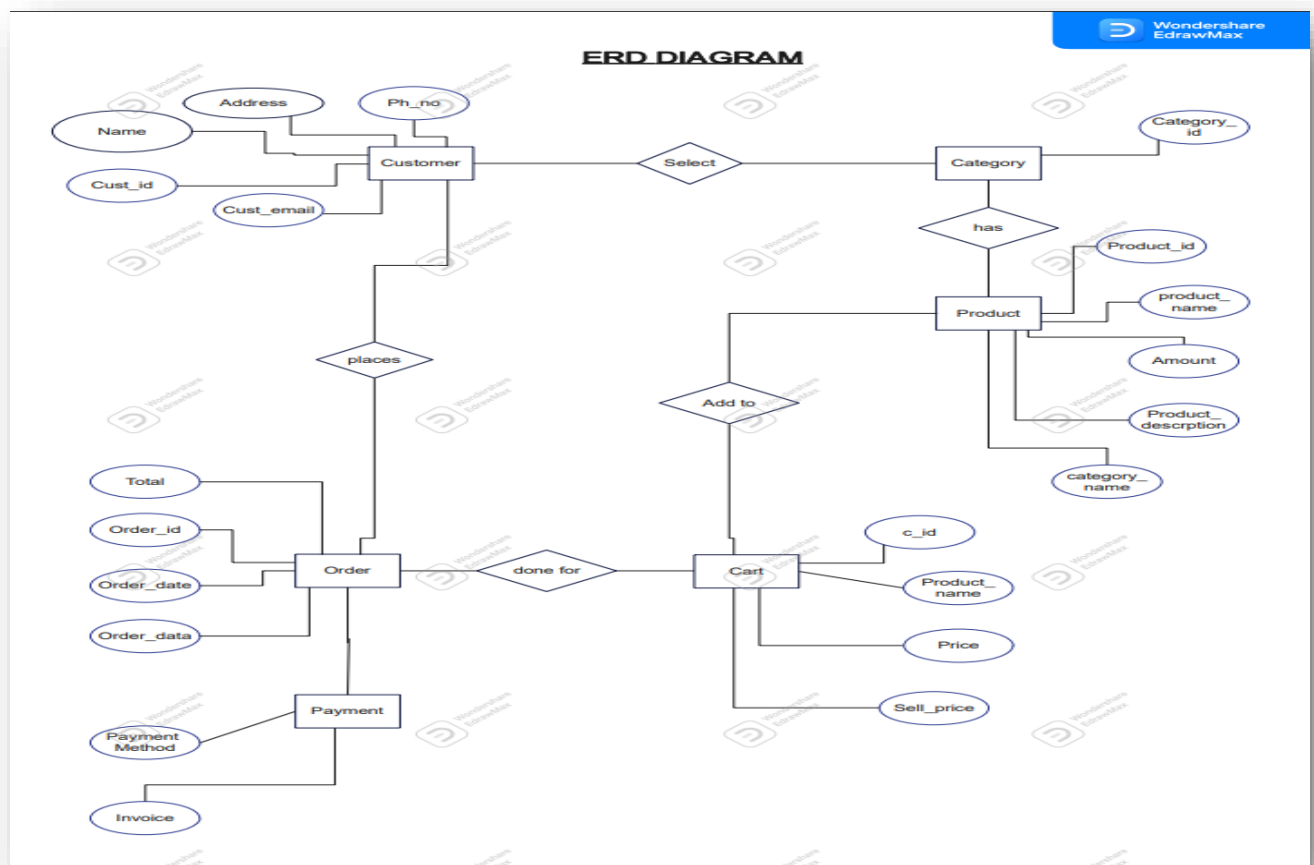

To manage details of Shopping, Sales, Internet, Payment, Bills, Customer.

### **2.3 User Requirements**

1. The system should create a login/logout page for customer to access their account.
2. The system should provide access to customers to place their orders and to see their latest orders.
3. The system should provide an online and offline payment option for customer.
4. The system should add a search bar option for customer to gain data about their product.

order_date	timestamp	YES		CURRENT_TIMESTAMP	DEFAULT_GENERATED
payment_mode	varchar(100)	YES		NULL	
payment_id	int	YES		NULL	

18 rows in set (0.00 sec)

- Product Table

```
mysql> desc tblproduct;
```

Field	Type	Null	Key	Default	Extra
id	bigint	NO	PRI	NULL	auto_increment
active	varchar(100)	YES		NULL	
code	varchar(5)	YES	UNI	NULL	
create_date	timestamp	NO		CURRENT_TIMESTAMP	DEFAULT_GENERATED
description	varchar(255)	YES		NULL	
image	varchar(100)	YES		NULL	
image_name	varchar(400)	YES		NULL	
name	varchar(30)	YES		NULL	
price	varchar(200)	YES		NULL	
mrp_price	varchar(200)	YES		NULL	
product_category	varchar(100)	YES		NULL	

```
11 rows in set (0.00 sec)
```

## CHAPTER 4 : USER MANUAL

### Drawbacks and Limitations

- As of now only COD payment method is available.
- Fixed size will be given no changes in size
- Inventory is not available in this version

### Proposed Enhancements

- We will add different payment methods like UPI, Credit Card, Debit Card etc.
- We will add variety of sizes
- We will add Inventory features

## ANNEXURES:

### ANNEXURE 1 : USER INTERFACE SCREENS

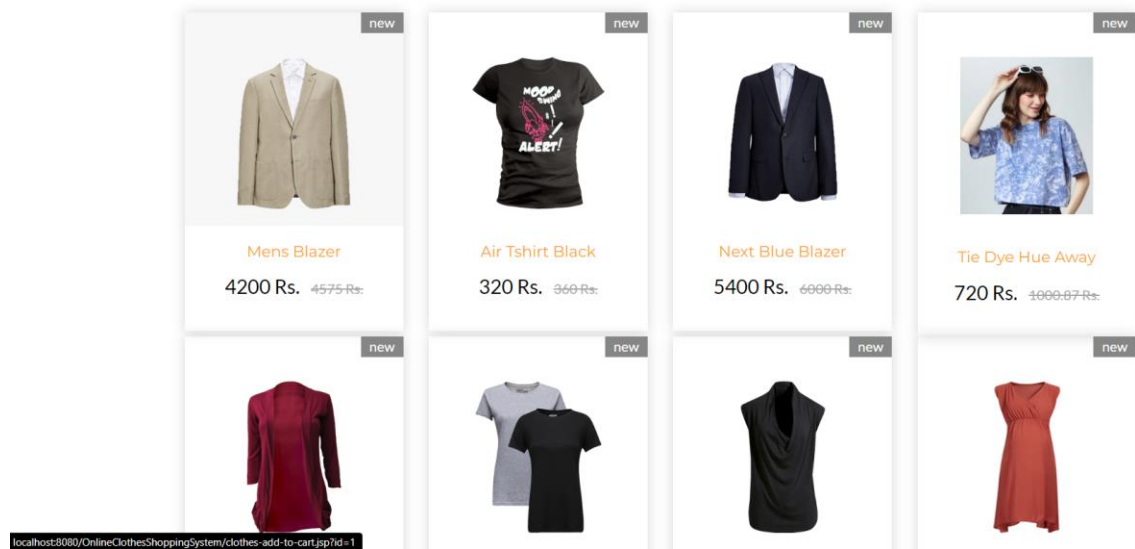

#### User Login:

The screenshot displays a web application interface for user login. At the top, there is a header section with a logo on the left, a search bar labeled 'Search Product' in the center, and an 'Admin Login' link on the right. Below the header is a navigation bar with links for HOME, MENS CLOTHES, WOMENS CLOTHES, VIEW FEEDBACK, CONTACT US, and LOGIN. A shopping cart icon indicates 0 items in the cart. A modal window titled 'Sign in with your account' is open, showing a login form with fields for Email (mandarkate03@gmail.com) and Password (masked with dots), a SIGNIN button, and a link to 'New create an account'.

User select products:
